

Garda

Technical sheet

Description	Straight
Material	Carbon steel
Pipes - Ø	25x1,5
Collectors - Ø	35x1,5
Connections	4x1/2" (air bleeding valve connection, included)
Wall fixings	4
Max operating pressure	10 bar
Max operating temperature	90 °C
Paint	Epoxy polyester powder
Packaging	Nylon bag, carton box, carton and styrofoam protections
Standard equipment	1 kit wall fixing brackets - 1 air bleeding valve - 1 blind plug

Connection

Min.	Max
62	72

-  DUAL FUEL USE
-  REVERSIBLE
-  ONLY 50 MM CONNECTIONS

Wall distance

Min.	Max
80	90

Suggested installations

In Out

White RAL9016 - straight

Our radiators are tested in qualified laboratories according to EN-442 regulations which determine the output value by fixing the ΔT at 50 °C. ΔT is the difference between the average temperature of the water inside the radiator and the room temperature. The formula is: $\frac{(T_1 + T_2)}{2} - T_3$.

Ex.: $\frac{(75 + 65)}{2} - 20 = 50$ °C. For output values with a different ΔT use the following formula: $\Phi_x = \Phi_{\Delta T_{50}} * (\Delta T_x / 50)^n$.

See calculation example of the output at ΔT 60 °C of article 388577: $366 * (60/50)^{1,23184} = 459$.

Output values in **kcal/h** = watt x 0,85984.

Output values in **btu** = watt x 3,412.

KEY

T_1 = supply temperature - T_2 = return temperature - T_3 = room temperature.

Φ_x = output to be calculated - $\Phi_{\Delta T_{50}}$ = output at ΔT 50 °C (table) - ΔT_x = ΔT value to be calculated - n = exponent "n" (table).
